

Setting codeignitor framework

For load the zip file

1.unzip [this](#)

2.copy the Apache/php path and set it to environment variable

3. Go to xampp control panel -> config -> php.ini -> remove extension intl and mysqli(when you have MySQL database) and postgresql pgsq or SQL (when you have postgresql database)

4. Run the command php spark serve

(For spark file run do this after that spark file run successfully)

5. .env file change the database name their driver and changes (firstly file is in env form make it .env) after that perform this changes

6. Then run the command to check php is run or not

7. Php spark serve also php spark make:migration migration_name

8. Done
